

Bellman equation:

$$\begin{aligned} V(k) &= \max u(c) + \beta V(k') \\ \text{s.t. } & c + k' - (1 - \delta)k \leq f(k) \\ & c, k' \geq 0. \end{aligned}$$

Value function iteration:

$$\begin{aligned} T(V)(k) &= \max u(c) + \beta V(k') \\ \text{s.t. } & c + k' - (1 - \delta)k \leq f(k) \\ & c, k' \geq 0. \end{aligned}$$

Start with a simple guess for  $V$ , for example,  $V_0$  such that

$$V_0(k) = 0 \text{ for all } k \in K.$$

Let  $V_1 = T(V_0)$  and continue to iterate  $V_{n+1} = T(V_n)$ . We will prove that the sequence  $V_0, V_1, V_2, \dots$  converges to a function  $\hat{V}$  such that  $\hat{V} = T(\hat{V})$ . Consequently,  $\hat{V}$  satisfies the Bellman equation.

Let  $K$  be the space of possible capital stocks, and let  $C(K)$  be the space of continuous, bounded functions defined on  $K$ .

For  $V, W \in C(K)$ , let

$$d(V, W) = \|V - W\| = \sup_{k \in K} |V(k) - W(k)|.$$

With this definition of a metric,  $C(K)$  is a Banach space, a complete normed vector space.

Let

$$T : C(K) \rightarrow C(K).$$

Suppose that for any  $V, W \in C(K)$ ,

$$\|T(V) - T(W)\| \leq \gamma \|V - W\|$$

for some fixed  $\gamma$ ,  $1 > \gamma > 0$ .

Then we call  $T$  a contraction mapping with modulus  $\gamma$ .

We want to show that mapping  $T$  defined by

$$\begin{aligned} T(V)(k) &= \max u(c) + \beta V(k') \\ \text{s.t. } & c + k' - (1 - \delta)k \leq f(k) \\ & c, k' \geq 0 \end{aligned}$$

maps continuous bounded functions into continuous bounded functions, that is,

$$T : C(K) \rightarrow C(K)$$

and that  $T$  is a contraction mapping with modulus  $\beta$ .

Then

$$\|V_{n+2} - V_{n+1}\| = \|T(V_{n+1}) - T(V_n)\| \leq \beta \|V_{n+1} - V_n\|$$

$$\|V_{n+2} - V_{n+1}\| \leq \beta^{n+1} \|V_1 - V_0\|.$$
